Purpose:

To evaluate the feasibility and efficacy of Internet-guided Cognitive Behavioral Therapy for Insomnia (eCBT-I) in Service Members and Veterans with a history of head injuries.

Traditional in-person eCBT-I is an effective treatment for insomnia.

This study aims to deliver in-person quality care using a computer or smartphone.

A possible benefit from participation is improved sleep and insomnia-related symptoms. A possible risk or discomfort is increased fatigue and/or anxiety following a brief period of mild sleep restriction. 1-2 hrs per week for 9 weeks + one 2 hr follow-up @ 3 months. Although financial compensation is not being offered, all participants will be given an opportunity to receive free open-label eCBT-I treatment upon study completion.

Protocol Title:

A Randomized, Controlled, Blinded Study of eCBT-I in Military Service Members with History of Traumatic Brain Injury

Principal Investigator:

David Brody, MD, PhD
Director, Center for Neuroscience & Regenerative Medicine

Associated Investigator:

J. Kent Werner, MD, PhD
Director of Research WRNMMC
Sleep Disorders Center
